

macOS Equivalents for Linux Commands

<https://gemini.google.com/app/0287537373192152>

User prompt: sudo apt update sudo apt install -y build-essential cmake libpcap-dev libssl-dev redis-server python3-venv sudo systemctl enable --now redis-server give me the commands for mac

Response: The macOS equivalent commands use **Homebrew** (the primary package manager for macOS) instead of `apt`.

Mac Equivalent Commands

```
# Update Homebrew package definitions
brew update
```

```
# Install Xcode Command Line Tools (provides build-essential, gcc, make, etc.)
xcode-select --install
```

```
# Install dependencies and Redis via Homebrew
brew install cmake libpcap openssl redis
```

```
# Start Redis and set it to run automatically on boot
brew services start redis
```

Note: macOS includes Python 3 and virtual environment support (`python3 -m venv`) out of the box once Command Line Tools are installed, so no separate package is required for `python3-venv`.
